

The Core Essence and Significant Importance of Adhering to the System Concept and Promoting High-quality Economic Development

Wenyan Lu

School of Marxism, Liaoning University of International Business and Economics, Dalian 116052, Liaoning, China

Abstract: *Adhering to the system concept to promote high-quality economic development, the core essence is to base on the overall system and oversee the overall high-quality economic development; Starting from the hierarchical and structural aspects of the system, systematically plan and grasp the overall situation; Efforts should be made to enhance the coordination of development, comprehensively consider and promote high-quality economic development. Adhering to the system concept to promote high-quality economic development is of great significance for improving the ability to scientifically predict economic risks, and for overall deployment and systematic promotion of high-quality economic development construction.*

Keywords: System concept, High quality development, New Development Concept.

1. Introduction

Valuing high-quality economic development is the primary task and essential requirement of social development. We must adhere to the system concept, which is an important thinking and working method to guide high-quality economic development and promote social construction. It is also an important principle that must be followed to promote China's economic and social development.

2. The Core Essence of Adhering to systematic Thinking to Promote High-quality Economic Development

Adhering to the system concept in high-quality economic development means observing and considering problems from a systematic perspective throughout the entire process and in all aspects, and coordinating the development conditions of various parts and elements to propose effective measures to promote the optimization of the economic system. On the basis of adhering to the integrity, structure, hierarchy, organic connection, and coordination of the system, we will oversee the overall high-quality development of the economy; Adhere to overall promotion and achieve optimal high-quality economic development.

2.1 Based on the Integrity of the System, We Will Oversee the Overall High-quality Development of the Economy

Adhering to the system concept to promote high-quality economic development, we must base ourselves on the overall system and start from the overall economic system. We should not only grasp the relationship between parts and the system as a whole, but also pay attention to advanced parts, focus on breakthroughs to drive overall development, improve backward parts, and reduce obstacles to system optimization; We also pay attention to the coordination of relationships between various parts. The policy measures to achieve high-quality economic development should form a combination of punches. To achieve a balance between the whole and its parts, as well as between parts, in the system, it is necessary to "comprehensively consider and balance,

highlight key points, and drive the overall situation. Sometimes we need to focus on the big and the small, while at other times we need to use the small to lead the big and see the big from the small.

Firstly, key breakthroughs should be made to drive overall improvement, and the implementation of the strategy of expanding domestic demand should be organically combined with deepening supply side structural reform. Expanding domestic demand is the strategic foundation, and supply side structural reform is the main line of high-quality development. Only by grasping these two key points can we better implement the new development concept and drive the overall improvement of high-quality development. The primary link in the development of the economic system is product production, and the ultimate value of products must be realized through market consumption to expand the consumer market required for high-quality economic development, while producing products that meet market demand. Therefore, it is necessary to achieve a key breakthrough by combining the strategy of expanding domestic demand with supply side structural reform, in order to coordinate and drive the overall development of the economic system and achieve high-quality development that promotes harmony and mutual promotion between the two parts.

On the one hand, we must adhere to the strategic basis of expanding domestic demand and strengthen demand side management. Establish an effective system to expand domestic demand, accelerate the cultivation of a complete domestic demand system, "enhance the fundamental role of consumption in economic development and the key role of investment in optimizing the supply structure, and build a strong domestic market with strong consumption and investment demand." On the other hand, adhere to the main line of supply side structural reform and solve supply side structural imbalances. To ensure the normal operation of the economic system and achieve high-quality development, it is necessary to optimize the structure of the economic system, solve the structural imbalance of the economic system through supply side structural reform, adjust the supply and demand relationship of the economy, the ratio of financial

economy to real economy, the ratio of real estate economy to real economy development, and enhance the resilience of the supply system and its adaptability to domestic demand.

The demand side and supply side are two fundamental components of the economic system, interdependent and mutually reinforcing. Expanding domestic demand is the guarantee of high-quality economic development in terms of quantity, providing strong market support to efficiently convert products into capital, and then invest in technological innovation and commodity reproduction to achieve industrial upgrading; Supply side structural reform is the "quality" guarantee for high-quality economic development, which produces products that meet people's needs, reduces overcapacity caused by the production of products that people do not like or need, lowers enterprise production costs, and leads residents' consumption upgrading. The organic combination of the two can achieve a creative transformation from production meeting people's needs to production leading people's needs.

Secondly, high-quality economic development is a comprehensive development of the five aspects under the new development concept, which must be fully, accurately, and comprehensively implemented. We must fully, accurately, and comprehensively implement the new development concept. High quality economic development is a problem of overall improvement of the economic system, which needs to be systematically addressed through the implementation of new development concepts. Innovation is the primary driving force for high-quality development. High quality development not only focuses on the accumulation of "quantity", but also seeks a leap in "quality". Innovative development addresses the issue of driving economic growth and achieves sustainable economic development; Coordination is an endogenous characteristic of high-quality development. Coordinate development to solve the problem of uneven economic development and achieve coordinated development in various fields and regions of the economy; High quality development is a sustainable development that combines economic development with high-level environmental protection. Green development solves the problem of the relationship between economy and ecology, achieving harmonious coexistence between humans and nature; Openness is the inevitable path to high-quality development. The technological exchange and economic connectivity brought about by openness achieve win-win and prosperous development. Open development solves the problem of the relationship between China's economic development and the world economy, and realizes the internal and external linkage of domestic and foreign dual circulation; Sharing is the fundamental purpose of high-quality development. The purpose of high-quality development is to better serve the people and ensure that development opportunities and achievements are shared by everyone. Shared development solves the problem of ownership of economic development achievements and achieves social equity. High quality economic development requires the overall improvement of these five aspects to ensure the continuous optimization of the economic system in terms of time and space.

Thirdly, high-quality economic development should drive the

overall development, and economic development should feed back the development of other fields, improving the quality and potential of economic development. The development and construction of our country is a holistic system, and the economic system is one of its important subsystems. High quality economic development is not only the progress of the economic system, but also brings about the development of other fields. Economic development and the development of other fields are interdependent. One is to drive the development of cultural industries with high-quality economic development, which provides development opportunities and material foundation for the transformation and upgrading of cultural industries. High quality development is the development that meets the needs of the people, which not only improves their living standards, but also promotes the upgrading of their spiritual and cultural needs, thereby promoting the development of the cultural industry towards a high-level and high-quality direction. The second is to drive social equity through high-quality economic development, and provide material guarantees for promoting social equity through high-quality economic development. The improvement of economic development level will drive the total amount of funds invested to ensure and improve people's livelihoods. The overall increase in national fiscal revenue will also lead to an increase in infrastructure construction expenditure, expanding the cake while promoting shared development achievements and promoting common prosperity. The third is to drive the construction of ecological civilization with high-quality economic development, reduce obstacles to environmental protection with high-quality economic development, and provide technical support. High quality development is green and environmentally friendly development, and sustainable development that reduces environmental pollution and resource waste. In addition, while high-quality economic development drives the development of other fields, the development of other fields also enhances the quality and potential of economic system development. Firstly, the high-quality development of the cultural industry will endow products with a spiritual core, enhance the cultural added value of products, increase the conversion rate of cultural products, and promote the development of the virtual economy and the tertiary industry; Secondly, high-quality development of social construction will enhance the stability of economic development. The improvement of the social security system will increase residents' confidence in consumption, adjust the "savings consumption" ratio, drive the overall consumption level and expectations of residents, and thus improve the sustainability and stability of economic development; The third is that the high-quality development of ecological civilization construction will promote sustainable economic development, reduce environmental pollution and ecological damage, reduce the consumption of non renewable resources, develop industries that utilize clean energy, and develop modern and efficient ecological industries. This is not only beneficial for controlling the increase in operating costs caused by the reduction of raw materials and fines, but also for actively transforming and upgrading industries, thereby improving the sustainability of economic development.

2.2 Starting from the Hierarchical and Structural Aspects of the System, the System Plans and Grasps the Overall

Situation

Adhering to the system concept should start from the hierarchical and structural aspects of the system, systematically plan and grasp the overall situation, promote the unity of self-development and mutual cooperation among various parts of the system, and achieve high-quality development of the economic system. The economic system of our country is not only an organic whole composed of elements such as urban-rural economy and regional economy, but also an element of the world economic system. Therefore, as a subsystem for high-quality development, China's economic system needs to coordinate the overall development of domestic and international economies, and create a new development pattern of domestic and international dual circulation. High quality economic development requires structural optimization of the economic system, combining the filling of shortcomings with development advantages. It is necessary to fill the gaps in the economic structure, comprehensively coordinate internal relationships at all levels, form complementary advantages, promote urban-rural integration, and promote regional coordinated development.

Firstly, grasp the hierarchical development requirements of the international and domestic economies in the economic system, coordinate the overall development of domestic and international economies, and construct a new development pattern of dual circulation between domestic and international markets. The high-quality development of our country's economy requires not only building a smooth domestic economic mother system, enhancing the endogenous power and reliability of the domestic circulation, but also playing a subsystem role in the international economy, improving the quality and level of the international circulation, and driving our own development. Adhere to the hierarchical nature of the system, base on different levels of the economic system, oversee the overall economic development, and achieve mutual promotion of domestic and international circulations with the domestic circulation as the mainstay. One is to enhance the endogenous power and reliability of the domestic circulation subsystem. Having a reliable and stable domestic economic system is the foundation for China to stand firm in the fierce world economic competition, and a smooth and powerful domestic circulation is an important source of strong attraction for China's international cooperation. The high-quality development of the Chinese economic system must adhere to the direction of socialist market economy reform. We must continue to unwaveringly adhere to the direction of socialist market economy reform, move forward vigorously and courageously, further promote market economy reform, and achieve high-quality economic development. Our country's economic system is embedded in the global economic environment, and economic globalization determines that our country must open up to the outside world. High level opening up to the outside world means opening up to the outside world on a larger scale, in a wider range of fields, and at a deeper level. The advantage of our country's economic system compared to other countries lies in having a super large market. We need to leverage our market advantages through greater openness, promote deeper international cooperation through wider areas of openness, and achieve multi domain exchanges and joint construction through deeper levels of openness, ultimately achieving

mutual benefit and win-win results. The third is to adhere to the dominant position of the domestic circulation, achieve the mutual promotion and development of the mother and child systems of the domestic and international circulations, smooth the domestic circulation, and realize the healthy operation of China's economic system. Through the strong domestic market in our country, the links of production, distribution, circulation, and consumption are interconnected, forming a higher-level dynamic balance of "demand driving supply, supply creating demand", and promoting a virtuous cycle in our economic system. To establish a mutually reinforcing development pattern of domestic and international dual circulation based on the domestic circulation, achieve a positive interaction between China's economic system and other countries' economic systems, and promote the mutual exchange and mutual promotion cycle between the advantages of China's economic system and the development needs of other countries' economic systems. By combining the strong domestic market advantages with the trade needs of other countries, we can create a strong gravitational field of global resource factors and achieve the overall development of China's economic system in terms of demand, trade, and investment.

Secondly, accelerate the structural construction of urban and rural economies in the economic system, fill in the gaps, focus on promoting urban-rural integration, and comprehensively promote rural revitalization. Is high-quality development achievable solely through the prosperous development of urban economy or the innovative development of industry and service industries. 'Comprehensive' reflects the need to achieve overall modernization in all aspects, fill the gaps in rural agriculture, and promote the development of rural and urban areas as a whole. It is necessary to promote the development of agriculture, manufacturing, and service industries as a whole, and develop the weakest parts of the system in order to achieve a leap in the overall strength of the economic system.

Making up for the shortcomings in agricultural and rural construction is an important measure to ensure national food security, and an important strategic choice to unify development and security in high-quality economic development. We must adhere to the priority development of agriculture and rural areas, and comprehensively promote the construction of a strong agricultural country. Developing agriculture, guarding the red line of arable land, encouraging agricultural technological innovation, and comprehensively consolidating the foundation of food security; Constructing rural areas, exploring the development of characteristic industries in rural areas, and expanding the space for farmers to become prosperous; Protect the vital interests of farmers, improve the mechanisms for guaranteeing farmers' income and compensating for their interests, and implement relevant agricultural assistance policies. We need to strengthen the construction of rural infrastructure, encourage the flow of development factors to rural areas through appropriate policy preferences, and accelerate the pace of rural development.

Thirdly, promote the structural optimization of regional economy in the economic system, achieve comprehensive coordination, complement each other's advantages, and promote regional coordinated development. In recent years,

significant development achievements have been made in the reform and opening up. The level and speed of economic development vary in different regions, and the regions that have become prosperous first and those that have become prosperous later together constitute the overall economic development system of China, occupying different strategic positions in the overall economic development. Coordinated development between parts is necessary to promote the overall coordinated development of the economic system. This requires not only achieving high-quality development in various regions, but also coordinating the development advantages and directions of each region, and building a high-quality regional economic situation with complementary advantages and reasonable division of labor.

On the one hand, each region should comprehensively consider favorable factors for economic development, adapt to local conditions, implement different development strategies, and achieve high-quality localized development. China has a vast territory, and the level of economic development varies among provinces and cities, but it is closely related to the resource level and limiting factors of regional economic development factors. On the other hand, coordinating the comparative advantages of economic development in different regions, implementing regional coordinated development strategies, optimizing the layout of major productive forces, and building a regional economic layout with complementary advantages. Different regions have their own development advantages, such as resource advantages, labor advantages, technological advantages, etc. Coordinating the relationships between regions, leveraging their comparative advantages, and avoiding policy barriers and resource waste caused by excessive clustering competition. At the same time, strengthen regional cooperation, promote market integration development, and facilitate the rational flow of economic development factors.

2.3 Efforts Should be Made to Enhance the Coordination of Development, Comprehensively Consider and Promote High-quality Economic Development

Adhering to the system concept, efforts should be made to enhance the coordination of development, coordinate the connections between various parts, and achieve high-quality development of the economic system. The various elements within the system are interconnected and interact with each other as an organic whole. Coordination is the proper handling of various relationships within and outside the system, creating favorable conditions and environment for the orderly operation of the system, and promoting the achievement of system goals. Therefore, it is necessary to coordinate the relationships between various parts, strengthen cooperation among them, reduce mutual constraints and internal consumption, and achieve high-quality economic development where the whole is greater than the sum of its parts.

Firstly, coordinating and managing various relationships in high-quality economic development is an inherent requirement for achieving high-quality economic development. High quality development is not only a reform of the economic development model, but also a profound adjustment of the interests between various economic entities,

components of the economic system, and development fields. It is necessary to break down the rigid barriers of interests. The relationship between various economic entities, various components of the economic system, and various fields of Chinese path to modernization development are closely linked. To achieve high-quality development of the economic system, we must first clarify the internal links between these three aspects, so as to grasp the overall situation and plan for development. If we do not consider the overall economic development and handle the relationship between these three parts well, high-quality development and reform will inevitably face significant obstacles, and development will be difficult to move forward. Therefore, it is necessary to start from the overall development of the economic system, handle the relationships between various parts well, build a high-level socialist market economy system, and achieve comprehensive and systematic high-quality development that unifies the quality, structure, scale, speed, efficiency, and security of economic development. With high-quality development, we can drive the overall situation and promote the realization of the goal of building a socialist country in all respects and modernization.

Secondly, it is necessary to coordinate and coordinate the relationships between various economic stakeholders, and build a high-level socialist market economy system. The reform of China's economic system mainly revolves around three pairs of relationships: the relationship between the market and the government, the relationship between the public and non-public sectors of the economy, and the relationship between the state-owned and private sectors of the economy. Clarifying and handling these three contradictory relationships in the overall development of the economic system is an inherent prerequisite for high-quality development. Handle the relationship between the market and the government well, fully leverage the decisive role of the market in resource allocation, and better leverage the role of the government. We must handle the relationship between the public ownership economy and the non-public ownership economy, unwaveringly consolidate and develop the public ownership economy, and unwaveringly encourage, support, and guide the development of the non-public ownership economy. Strive for progress while maintaining stability, and achieve coordinated development between the public and non-public sectors of the economy. We need to handle the relationship between state-owned economy and private economy well. Optimize the business environment, accelerate the optimization and structural adjustment of state-owned economy layout, and promote the development and growth of private economy. Realize the coordinated development of state-owned economy and private economy.

Thirdly, it is necessary to coordinate the relationships between various components of the economic system, build a modern industrial system, and achieve high-quality development that unifies the quality, structure, scale, speed, efficiency, and safety of economic development. High quality economic development should achieve the unity of development quality, structure, scale, speed, efficiency, and safety. The six development elements of the economic system are interdependent, mutually restrictive, and mutually reinforcing. To allocate limited development resources reasonably, coordinate the internal relationships of the six

elements, reduce mutual constraints, promote common development, and create a unified economic system with six elements, it is necessary to handle the two pairs of relationships within the economic system well and achieve coordination between various parts of the system. The economic system contains two pairs of contradictory relationships, namely the relationship between the primary industry, the secondary industry, and the tertiary industry; The relationship between the real economy and the virtual economy. By handling two pairs of relationships well, we can achieve high-quality development that unifies development quality, speed, efficiency, and safety, as well as development structure and scale. The adjustment and upgrading of China's industrial structure requires handling the relationship between the primary, secondary, and tertiary industries in high-quality development. The primary, secondary, and tertiary industries should not only deeply cultivate and develop in their respective fields, but also deeply integrate to promote the upgrading of industrial structure. Advanced manufacturing should drive the upgrading of the primary and tertiary industries, and promote the integration of the tertiary industry with modern agriculture and advanced manufacturing. Only by handling the relationship between the primary, secondary, and tertiary industries well can we achieve high-quality development with a unified development structure and scale.

Fourthly, we need to handle the relationship between the real economy and the virtual economy well, and achieve high-quality development that unifies development quality, speed, efficiency, and security. The real economy is the foundation of the national economy and is directly related to the ability of the national economy to resist systemic risks. It is necessary to adhere to the pillar position of the real economy. The expansion of the digital economy and the acceleration of global digital transformation have become important factors affecting the world economic landscape. It is necessary to accelerate the development of the digital economy, unleash the potential of the digital economy to promote economic growth, and seize the high ground of the new round of technological revolution and industrial transformation. To handle the relationship between the real economy and the virtual economy in high-quality development, we must not only focus on the real economy, but also accelerate the development of the digital economy, so that the two can promote each other and deeply integrate. The development of the two parts mutually promotes and drives the high-quality development of the overall quality, speed, efficiency, and security of the economic system.

3. The Importance of Adhering to the System Concept and Promoting High Quality Economic Development

Adhering to the system concept and promoting high-quality economic development is a necessary scientific choice. The economic system is an open and complex system that includes interconnected and interdependent parts. Grasping the laws of operation and development of the economic system is the ideological prerequisite for achieving high-quality economic development. Adhering to the system concept and promoting high-quality economic development has significant strategic significance.

3.1 Helps to Strengthen Systems Thinking and Improve the Ability to Scientifically Predict Economic Risks

The economic system is not a static closed system, but one that interacts with the outside world and constantly develops and changes. We must adhere to the system concept and view problems from the perspective of development and change. Adhering to the system concept to promote high-quality economic development will help leading cadres strengthen strategic, systematic, and forward-looking research and planning, be good at grasping the development logic from complex contradictions, adhere to the development stance and direction, and formulate plans that are both firm in the path of socialism with Chinese characteristics and in line with the laws of China's economic and social development. Adhering to the system concept to promote high-quality economic development requires that economic development policies be formulated based on objective laws of economic development, foreseeing the economic development situation, and through systematic forward-looking thinking, formulating economic development plans that can not only solve the current prominent problems of the economic system, but also meet the future smooth development of the economic system.

Adhering to the system concept to promote high-quality economic development helps us strengthen systematic thinking and improve our ability to scientifically predict economic risks. The important reason why our country's economy can still reach new heights is that our party has scientifically predicted the overall trend of economic development and avoided financial development risks. The system concept helps us scientifically predict economic risks, mainly manifested in three aspects: firstly, it helps us to be prepared for danger in times of peace, anticipate potential economic risks, challenges, and development opportunities in the future. In the overall positive development trend of China's economy, we must adhere to a sense of crisis and bottom line thinking, not be obscured by the current economic prosperity and look to the future. We must adhere to the perspective of medium and long-term development, calmly view the shortcomings of economic development, foresee possible economic risks, and seize the initiative. At present, China is facing a turbulent international environment, with global inflation bringing economic development pressure, the overall decline of the domestic economy, and the contradiction of insufficient effective demand. This requires us to be cautious and anticipate the risks of economic system development. Secondly, it helps us to be constantly prepared, anticipate and prevent potential systemic risks in the economic system, grasp the characteristics of the development and changes of the economic system, establish and improve the economic risk monitoring and early warning system, and enhance our ability to prevent and resolve major risks. The normal operation of the economic system follows a cyclical pattern, and we need to grasp the overall trajectory of economic operations. At the same time, the occurrence of economic events also has its objectivity and randomness. We need to strengthen monitoring of real-time economic trends and establish a sound economic risk warning mechanism to predict and avoid systemic risks as much as possible, and reduce economic losses. Thirdly, it helps us to prepare for potential systemic risks, propose scientific contingency plans, timely eliminate hidden dangers in economic system

development, and ultimately achieve healthy economic system development. Everything should be planned in advance, and failure to do so will lead to failure. With a development perspective and foresight, we should think about the structural problems and systemic risks that economic development may face, and use a systematic approach to timely predict and avoid the pitfalls of economic system development, avoiding detours and wrong paths.

3.2 Conducive to the Overall Deployment and Systematic Promotion of High-quality Economic Development and Construction

The economic system is an organic whole, and we must adhere to the concept of systems and observe things from a comprehensive and systematic perspective. Therefore, we need to balance all aspects and adhere to overall planning. The relationships between various parts of the economic system, economic entities, and development factors are universally interconnected, and economic reforms often have a ripple effect. So in order to achieve high-quality economic development, it is necessary to work together from multiple aspects, handle the relationships between various parts through systematic global planning, coordinate the interests of various subjects, coordinate the enthusiasm of various factors for development, and formulate an overall layout covering all aspects of economic system development.

Adhering to the system concept to promote high-quality economic development is conducive to overall deployment and systematic promotion of high-quality economic development construction. To take overall optimization as the basis, it is not only required that each part be optimal. What kind of elements there are, what kind of system there is. Optimizing and cooperating with each other can achieve the optimal solution for high-quality economic development. This is mainly manifested in three aspects: firstly, to coordinate the overall situation and the entire process of economic system operation. The operation of the economic system includes four parts: production, distribution, circulation, and consumption. To achieve high-quality development of the economic system, we cannot only focus on one part, but also take into account all parts. High quality development is the high-quality development of every link in the economic system. Adhering to a systematic approach helps to produce high-quality products that meet market demand; Conducive to high-quality distribution, through urban-rural integration, regional coordinated development, and fair distribution of development resources and achievements; Helps to facilitate high-quality circulation and smooth domestic and international dual circulation; Helps to consume with high quality and expand market demand; Conducive to the construction of high-quality institutions, namely the modernization of the economic system, to ensure the sustainability of high-quality development. The second is overall deployment, grasping the dialectical relationship between the whole and the parts. High quality economic development is not only about the high-quality development of cities and developed areas, but also about the high-quality development of all people, covering all regions. Merely developing the economy in advanced regions and prominent areas is not enough to drive the overall economic development. We need to promote high-quality development

in key regions and fields, coordinate the development speed of underdeveloped areas and fields, promote urban-rural integration and regional coordination, strengthen the strategic deployment of the whole country, and base ourselves on the overall economic development situation to achieve a comprehensive plan for high-quality development. To achieve high-quality development, we cannot only develop coastal and advanced areas, but also carry out poverty alleviation campaigns in old, young, border and poor areas. Each part should obey the overall situation, focus on the big picture, and when the development conditions between regions are similar, cooperate more, leverage comparative advantages, reduce malicious competition and low price competition, and shift from price wars to quality wars. The third is to coordinate and promote, and to coordinate the relationship between parts and elements. Based on the overall situation, coordinate the interests of various parts of the economic system, allocate development factors reasonably, mobilize the development enthusiasm of all parties, create a new development pattern, and form a joint force for economic development. The development of the economic system requires support and assistance from multiple aspects. Only when the six major development factors are unified, and all parts work together to form a closely connected economic system as a whole, can high-quality economic development be achieved.

In short, the system concept is a scientific thinking method for promoting high-quality economic development. Only by deeply understanding the system concept and fully grasping the core essence of adhering to the system concept to promote high-quality economic development, can we better construct a new development pattern as a whole with the system concept and continue to promote connotative and high-quality development.
